# Indefinite integrals

## Indefinite integrals as antiderivatives

- Antiderivative: the opposite (inverse operation) of a derivative.
- The **indefinite integral** is an antiderivative.

#### Examples:

• 
$$\frac{d}{dx}\frac{x^3}{3} = x^2$$
, so  $\int x^2 dx = \frac{x^3}{3} + C$ 

## Indefinite integrals as antiderivatives

- Antiderivative: the opposite (inverse operation) of a derivative.
- The indefinite integral is an antiderivative.

#### Examples:

• 
$$\frac{d}{dx}\frac{x^3}{3} = x^2$$
, so  $\int x^2 dx = \frac{x^3}{3} + C$ 

• 
$$\frac{d}{dx}\arcsin(x) = \frac{1}{\sqrt{1-x^2}}$$
, so  $\int \frac{dx}{\sqrt{1-x^2}} = \arcsin(x) + C$ .

## Indefinite integrals as antiderivatives

- Antiderivative: the opposite (inverse operation) of a derivative.
- The indefinite integral is an antiderivative.

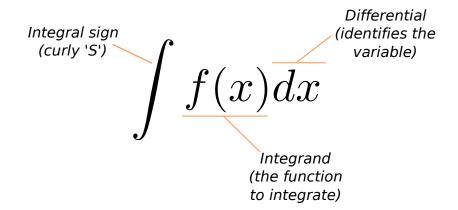

#### Examples:

• 
$$\frac{d}{dx}\frac{x^3}{3} = x^2$$
, so  $\int x^2 dx = \frac{x^3}{3} + C$ 

• 
$$\frac{d}{dx}\arcsin(x) = \frac{1}{\sqrt{1-x^2}}$$
, so  $\int \frac{dx}{\sqrt{1-x^2}} = \arcsin(x) + C$ .

In these examples, C is an **arbitrary constant**.

# Anatomy of an indefinite integral

#### Polynomials:

• 
$$\int x^n dx = \frac{x^{n+1}}{n+1} + C \text{ for } n \neq -1$$
• 
$$\int \frac{dx}{x} = \ln|x| + C$$

#### Trigonometric functions:

• 
$$\int \sin x \, dx = -\cos x + C$$
  $\int \tan x \, dx = -\ln|\cos x| + C$   
•  $\int \cos x \, dx = \sin x + C$  Not an obvious antiderivative; we will see how to derive this integral later.

Exponential/logarithmic functions:

$$\bullet \int \frac{dx}{x} = \ln|x| + C$$

Inverse trigonometric functions:

• 
$$\int \frac{dx}{\sqrt{1-x^2}} = \arcsin(x) + C$$
• 
$$\int \frac{dx}{1+x^2} = \arctan(x) + C$$

• 
$$\int \frac{dx}{1+x^2} = \arctan(x) + C$$

#### Special cases:

• 
$$\int \sec^2 x \, dx = \tan x + C$$
• 
$$\int \csc^2 x \, dx = -\cot x + C$$
• 
$$\int \sec x \tan x \, dx = \sec x + C$$
• 
$$\int \csc x \cot x \, dx = -\csc x + C$$

# Definite integrals

## The definite integral

Definite integral: integral with "bounds"

$$\int_{a}^{b} f(x) dx = F(b) - F(a)$$
 Lower bound

How to compute:

• Find primitive function 
$$F(x)$$
:  $\int f(x) dx = F(x) + C$ 

**2** Substitute bounds into F(x):

$$\int_{a}^{b} f(x)dx = F(b) - F(a) = F(x)\Big|_{a}^{b}.$$

#### Compute:

$$\bullet \int_0^{\pi/2} \sin x \, dx$$

$$\bullet \int_{-1}^2 (x^2 + 2x - 1) \, dx$$

• 
$$\int_{a}^{a} f(x)dx = F(a) - F(a) = 0$$
• 
$$\int_{a}^{b} f(x)dx = -\int_{b}^{a} f(x)dx$$

Linearity:

$$\int_{a}^{b} (Af(x) + Bg(x))dx = A \int_{a}^{b} f(x)dx + B \int_{a}^{b} g(x)dx$$

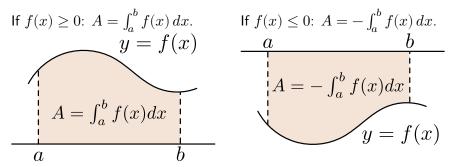

• 
$$\int_{a}^{b} f(x)dx = -\int_{b}^{a} f(x)dx$$

Linearity:

$$\int_a^b (Af(x)+Bg(x))dx = A\int_a^b f(x)dx + B\int_a^b g(x)dx$$

• 
$$\int_{a}^{b} f(x)dx + \int_{b}^{c} f(x)dx = \int_{a}^{c} f(x)dx$$

# Definite integrals correspond to signed areas

If f(x) changes sign: break up into parts above/below x-axis.

Find the area...

- Between the graph of  $y = \sin x$  and the x-axis, from 0 to  $2\pi$ .
- Below the graph of  $y = 3x x^2$  and above the x-axis.

# Properties (continued)

• For an even function,  $\int_{-a}^{a} f(x)dx = 2 \int_{0}^{a} f(x)dx$ 

# Properties (continued)

- For an even function,  $\int_{-a}^{a} f(x)dx = 2 \int_{0}^{a} f(x)dx$
- For an odd function,  $\int_{-\hat{a}}^{\hat{a}} f(x) = 0$ .

# Properties (continued)

- For an even function,  $\int_{-a}^{a} f(x)dx = 2 \int_{0}^{a} f(x)dx$
- For an odd function,  $\int_{-a}^{a} f(x) = 0$ .
- "King's rule":  $\int_0^a f(x)dx = \int_0^a f(a-x)dx.$

## Continuity and integration

- So far, we have silently assumed f(x) is continuous on [a,b] to define the integral  $\int_a^b f(x) dx$ .
- The integral can also be defined if f(x) is **piecewise** continuous.

Compute the following integrals:

• 
$$\int_{1}^{1} \left( 10x^4 - \frac{2}{\sqrt{1-x^2}} \right) dx$$

$$\bullet \int \frac{x^2}{1+x^2} \, dx$$

Show that 
$$\int_0^{\pi/2} \frac{\sin x}{\sin x + \cos x} dx = \frac{\pi}{4}.$$

Difficult, uses King's rule.

## Fundamental theorem of calculus

## Integrals and derivatives are each other's inverse

- If  $G(x) = \int_1^x \ln y \, dy$ , find G'(x).
- If  $H(x) = \int_{1}^{x^2} \ln y \, dy$ , find H'(x).
